GEODATA

SPONSORSHIP
2026 - 2027

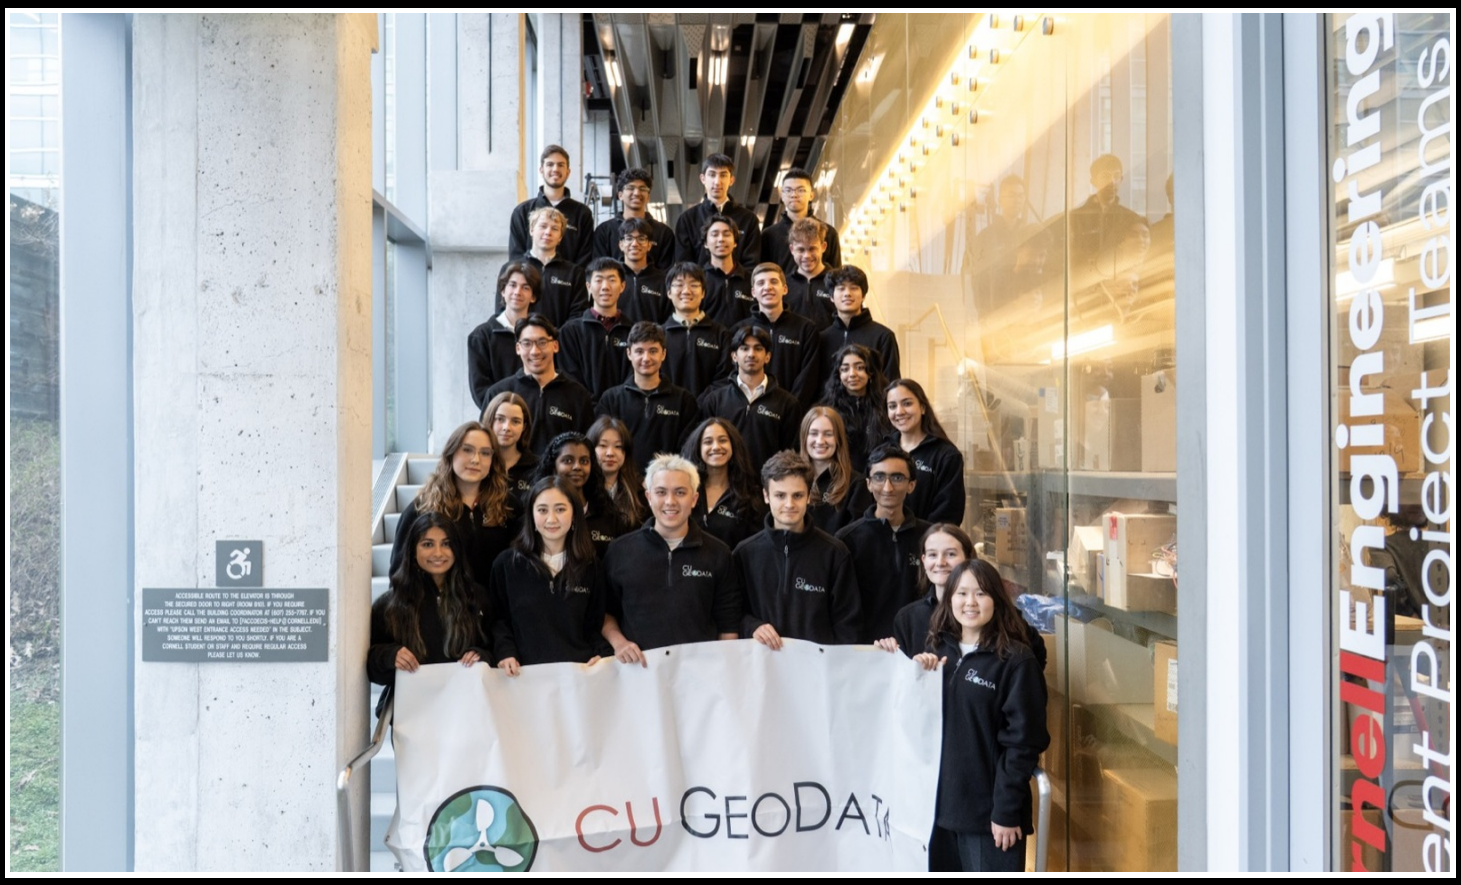

Cornell Duffield
Engineering

WHO WE ARE

GeoData is a Cornell Engineering project team of 40 students. We design, build, and deploy our own sensors to study the air, water, and ground around the Finger Lakes.

We have six subteams: Air, Water, Rock, Data, Tech, and Business. Our members study computer science, environmental engineering, physics, atmospheric science, statistics, and more. Together, we build real instruments, analyze field data, and learn to understand and protect our environment.

TEAM PHOTO 2026

WHY SPONSOR US?

Your support puts sensors, parts, and research tools into students' hands. It funds the fabrication and fieldwork that turn an idea into an instrument, and its measurements into useful data.

Student fieldwork at a soil-moisture station

Fieldwork connects what we build in the lab with the environments we study.

Build practical skills

Students design circuits, fabricate parts, write software, and troubleshoot instruments outdoors. Your support helps them take responsibility for a complete engineering project.

Support local research

Help us measure the air, water, and soil around the Finger Lakes. Contributions fund sensors, field materials, and reliable systems for collecting environmental data.

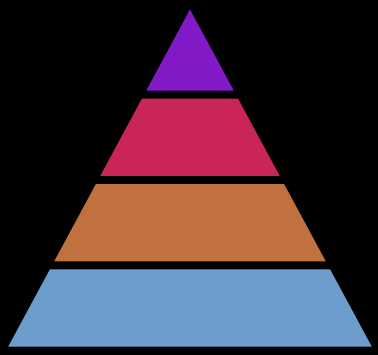

Meet our students

Connect with engineers and scientists through the team resume book, project visibility, and recruiting opportunities included in your sponsorship level.

SPONSORSHIP LEVELS

Choose a level of support. Each higher level includes the benefits of the preceding levels.

We also welcome equipment, fabrication services, and technical expertise. Contact us to discuss an in-kind contribution.

QUARTZ — $500+

Team resume book; a decal on a soil-moisture node at the Game Farm site; a thank-you in the alumni newsletter.

TOPAZ — $1,500+

Includes Quartz, plus a Cayuga Lake sensor-station decal and deployment-day photo; a logo on our website; a field feature on social media.

RUBY — $3,000+

Everything in Topaz, plus a tethersonde decal flown to 500 feet; logo on team apparel; job postings in the alumni newsletter; an info session or recruiting event with the team.

DIAMOND — $5,000+

Everything in Ruby, plus decals on the LiDAR hexapod and survey drone; a lake sensor site named after you; first invite to demo day.

We will coordinate recognition, events, and project timing with you.

OUR CURRENT PROJECTS

LiDAR Hexapod

With Cornell Physical Intelligence, we are developing a six-legged robot for environmental surveys. LiDAR, cameras, and autonomous navigation will support mapping across uneven terrain. The latest design is learning to walk in simulation ahead of a physical build.

Design visualization; robot in development

Refitting the research buoy

Cayuga Buoy Station

We are refitting a research buoy to monitor weather and water quality on Cayuga Lake. Sensors above and below the surface will measure lake and atmospheric conditions together. The refit includes mooring, power, and telemetry systems.

Atmospheric Sensors

Our student-built tethersonde measures how temperature, humidity, pressure, and wind change with height. Alongside it, we build weather stations using UCAR's open-source 3DPAWS design. These instruments help us study boundary-layer and lake-effect weather around Ithaca.

Preparing for atmospheric fieldwork
