GEODATA

PROJECT TEAM

SPONSORSHIP
2026 - 2027

Cornell Duffield
Engineering

WHO WE ARE

GeoData is a Cornell Engineering project team of 40 students. We design, build, deploy and analyze our own sensors and data to study the air, water and ground around the Finger Lakes.

We have six subteams: Air, Water, Rock, Data, Tech and Business. Our members study computer science, environmental engineering, physics, atmospheric science, statistics and more. Every instrument we put in the field is built or deployed by students and teaches the future engineers who will protect our planet.

WHY SPONSOR US?

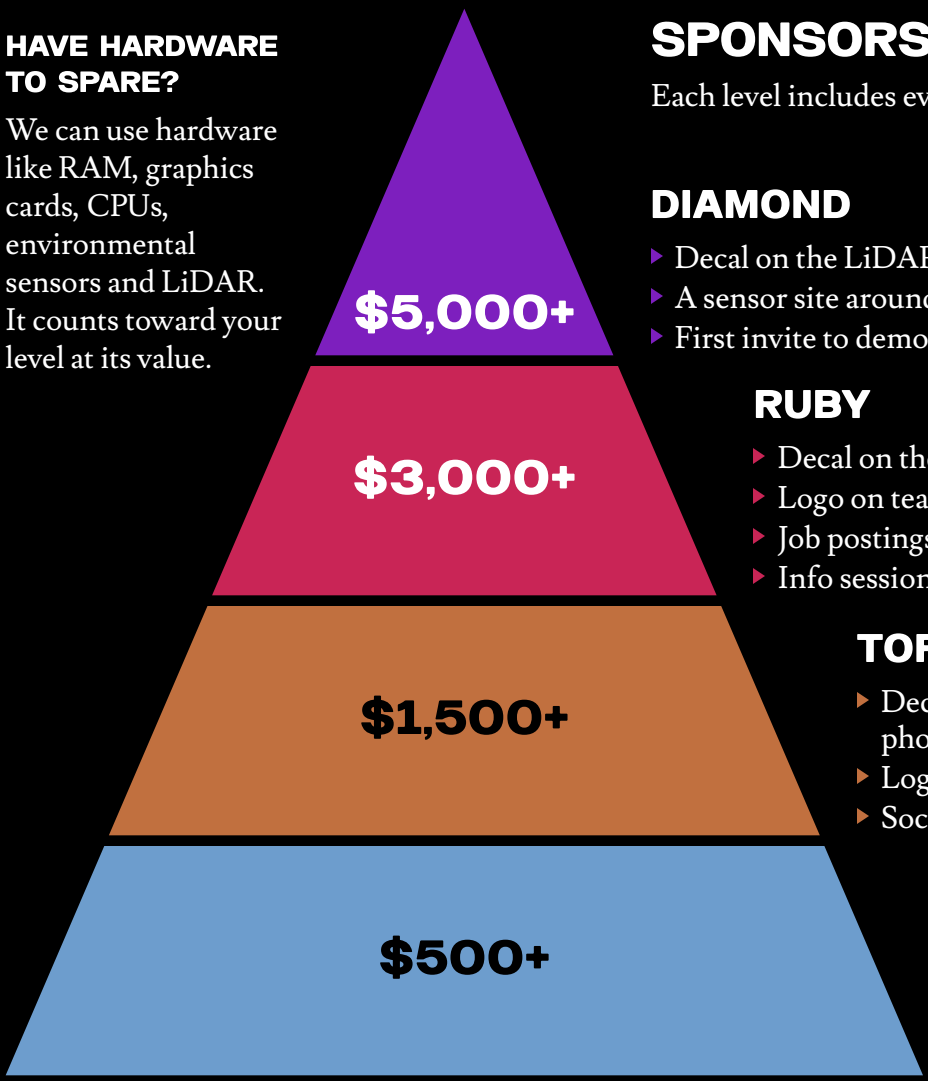

GeoData runs almost entirely on sponsor support. Your contribution goes straight into the parts, sensors, and field deployments that keep our projects running year-round. It puts current technology like LiDAR, machine learning models, and research-grade instruments into the hands of undergraduates who would otherwise only read about it.

Every dollar helps a student design, build, and deploy something that is actually out in the field collecting data. Sponsors get to know these engineers and scientists early, while they're solving real problems.

HAVE HARDWARE TO SPARE?

We can use hardware like RAM, graphics cards, CPUs, environmental sensors and LiDAR. It counts toward your level at its value.

SPONSORSHIP LEVELS

Each level includes everything below it.

DIAMOND

- Decal on the LiDAR hexapod robot and the survey drone
- A sensor site around the lake named after you
- First invite to demo day

RUBY

- Decal on the tethersonde, flown to 500 feet
- Logo on team apparel
- Job postings featured in the alumni newsletter
- Info session or recruiting event with the team

TOPAZ

- Decal on a Cayuga Lake sensor station, photographed on deployment day
- Logo on our website
- Social media feature from the field

QUARTZ

- Team resume book
- Decal on a soil-moisture node at the Game Farm site
- Thank-you in the alumni newsletter

OUR CURRENT PROJECTS

LiDAR Hexapod

A walking survey robot we're building with Cornell Physical Intelligence to map 3D terrain. Six legs, two cameras and a Livox LiDAR sensor will scan any area of interest. We're training it in simulation with Isaac Sim, Cosmos and RL gait training to cross textured forest floors, with our own vision models for obstacle detection and path planning.

Cayuga Buoy Station

A research buoy we're refitting and anchoring in Cayuga Lake as a floating water and weather station. Sensors below the surface and a meteorological station above it will record both sides of the exchange that drives lake-effect snow. We're building the mooring, power system and telemetry so it can report live through the season.

Atmospheric Sensors

Two projects that measure the air around Ithaca from the ground up. Our tethersonde flies up to 500 feet, profiling temperature, humidity, pressure and wind through the boundary layer. On the ground, we build 3D-printed weather stations on UCAR's 3DPAWS design at a fraction of commercial cost. Together they will feed a local network for training our own weather models.

CROWDFUNDING IS OPEN

Give any amount through Cornell Crowdfunding until December 5. Every gift is a donation to Cornell University, so it's tax-deductible, and you'll get a tax receipt.
